

IT FORENSICS EXTRACT CLOUDAXIS INCIDENT ANALYSIS

Reference: ITFE-TV-2026-05-02

Prepared by: TechVenture IT Security and External Consultant

Date: May 2, 2026

Purpose

This extract documents technical findings from TechVenture's review of available logs, API exports, and CloudAxis-provided incident documentation.

Key Technical Findings

1) Migration Scheduling Evidence

CloudAxis internal change management records (shared on request) show the infrastructure migration was scheduled in CloudAxis's internal system on April 24, 2026 one day before the claimed zero-day vulnerability discovery date.

This is inconsistent with CloudAxis's claim that it was an emergency response.

2) Backup Snapshot Gap

CloudAxis provided backup log exports showing:

- Last successful full backup: April 20, 2026 at 02:15
- Last successful incremental backup: April 25, 2026 at 02:15
- Snapshot creation for migration: April 26, 2026 at 11:30
- Snapshot marked as failed: April 26, 2026 at 14:15
- First recovery attempt: April 27, 2026 at 06:00

The data gap is confirmed as April 25 14:00 to April 26 14:20 (approximately 24 hours 20 minutes) not 18 hours as CloudAxis claims.

3) P1 Escalation Log Discrepancy

CloudAxis claims internal P1 escalation occurred at 18:45 on April 26.

TechVenture ticket portal shows no external escalation update was posted until April 27 at 06:00. The SLA clock for P1 resolution commenced at 14:35 on April 26 when TechVenture opened the ticket. Resolution at April 27 09:15 = 18 hours 40 minutes. The 8 business hour P1 SLA was materially exceeded regardless of internal escalation.

4) Data Classification of Lost Records

- April 25 payroll batch: contains personal data of 214 employees (names, salary data, bank account references)
- This data is personal data under Act 63-2004
- Loss of this data likely triggers a regulatory notification obligation
- CloudAxis's 28 April notification was 26 hours after confirmed discovery

5) ISO 27001 Certificate Status

CloudAxis's publicly available ISO 27001 certificate expired on March 3, 2026.

No renewal certificate has been provided. The agreement requires active certification throughout the contract term. This is an independent contractual breach.

Evidence Quality Assessment

- Machine-generated timestamps from CloudAxis backup logs are strong evidence
- Internal CloudAxis change management records contradict the force-majeure defense
- The certificate expiry is documented and not disputed
- Data classification of lost payroll records is clear and well-supported

Gaps Remaining

- CloudAxis has not provided the full migration run-book or approval chain
- The zero-day vulnerability claim has not been independently verified
- Customer transaction reconciliation is not yet complete
